AJO Journey Optimization: Engagement, Conversion, and Revenue Attribution

Omni-Channel - Multi-Industry | Last 50 Full days Mar 10, 2026 - Apr 10, 2026

Panel 1 — AJO Journey Performance Overview (Are journeys working?)

Panel 1 — AJO Journey Performance Overview

Table: Journey Message Performance & Conversion Summary
Rows:
- Journey (AJO)
- Delivery Rate
- Open Rate
- Click-Through Rate (CTR)
- Click-to-Order Conversion Rate
- Unique Clickers
- Total Orders

Purpose
- Evaluate end-to-end journey performance from message delivery → engagement → conversion
- Measure the effectiveness of AJO messaging in driving downstream customer actions
- Compare journey performance across engagement and conversion metrics
- Identify whether differences in outcomes are driven by scale (volume) or efficiency (conversion)
- Establish a baseline for journey optimization and scaling decisions

Panel 1 — AJO Journey Performance Insights

Key Insights
- **Strong engagement across all journeys.** Open rates (~60%) and CTR (~68%) indicate highly effective messaging and strong audience responsiveness.
- **High post-click conversion efficiency.** ~65% of clickers convert to orders, showing strong alignment between messaging, targeting, and downstream experience.
- **Conversion rates are consistent across journeys.** Minimal variation (~65–66%) suggests similar user intent and behavior regardless of journey entry point.
- **Performance differences are driven by scale, not efficiency.** Higher order journeys are primarily those with greater message volume, not better conversion rates.

Implication
Overall performance is driven more by **reach and audience volume** than by differences in conversion efficiency, indicating that scaling high-performing journeys will yield the greatest incremental impact.

Note: These results reflect a highly engaged, targeted audience and should be validated against broader campaign performance. Could be a factor of the demo data set.

Journey Performance KPIs (AJO)

Messages Sent	Delivery Rate	Open Rate	Click-Through Rate (CTR)	Total Revenue	Revenue per Order
101,694	69.1%	79.6%	68.0%	$53,198,573	$621
Retail: Journey Name (AJO)	Retail: Journey Name (AJO)	Retail: Journey Name (AJO)	Retail: Journey Name (AJO)	Total Revenue (Last Touch | Session) - Retail: Journey Name (AJO)	Revenue per Order (last touch - session) - Retail: Journey Name (AJO)

Click-to-Order Conversion Rate	Unique Clickers	Total Orders

Panel 2 — AJO Effectiveness (Which journeys matter?)

Omni-Channel - Multi-Industry | Last 50 Full days Mar 10, 2026 - Apr 10, 2026

Panel 2 — AJO Effectiveness Overview

Visuals:
- Journey Entry Flow (Sankey)
- Journey → Orders Flow (Sankey)
- Orders by Journey (bar)
- Conversion Rate by Journey (bar / scatter)

Purpose
- Identify which journeys contribute most to total business outcomes (orders)
- Evaluate whether performance is driven by entry volume or downstream effectiveness
- Understand how users flow into and through journeys
- Highlight high-impact journeys for prioritization and scaling
- Distinguish between high-volume vs high-efficiency journeys

Panel 2 — AJO Effectiveness Insights

Key Insights
- **Purchase Abandonment is the dominant driver of orders.** It leads both in entry volume and total orders, making it the highest impact journey.
- **Journey entry volume strongly correlates with outcomes.** Journeys with higher entry volume generate more orders, reinforcing that scale drives performance.
- **Conversion efficiency remains consistent across journeys.** Similar conversion rates across journeys indicate that differences in outcomes are not due to journey quality.
- **No clear outlier in conversion performance.** All journeys perform similarly post-click, suggesting a uniformly strong downstream experience.

Implication
Business impact is concentrated in high-volume journeys, particularly Purchase Abandonment, making these ideal candidates for **increased investment and optimization**.

Note: These results reflect a highly engaged, targeted audience and should be validated against broader campaign performance. Could be a factor of the demo data set.

Panel 3 — Journey Flow, Channel Performance & Revenue Drivers (Why it's happening)

Omni-Channel - Multi-Industry | This month Apr 1, 2026 - Apr 30, 2026

Panel 3 — Journey Flow, Channel Performance & Revenue Drivers

Visuals:
- Journey Message Status (Sent → Delivered → Opens → Clicks → Orders)
- Journey x Channel Performance Table
- Journey Message Volume (Email, SMS, Push)
- Revenue per Order by Channel

Purpose
- Explain why performance differs across journeys using channel and flow data
- Identify which channels drive the highest revenue and which underperform despite volume
- Identify which channels drive the highest revenue and efficiency within each journey
- Evaluate differences in revenue per order across journeys and channels
- Provide actionable insights for channel mix optimization

Panel 3 — Journey Flow, Channel Performance & Revenue Drivers Insights

Key Insights
1. **Email is the primary revenue-driving channel.** Email generates the largest share of total revenue (~$19.5M), significantly outperforming SMS and Push.
2. **Purchase Abandonment drives the highest total revenue.** It contributes the largest share of both orders and revenue (~$14.4M), confirming its role as the top performing journey.
3. **Higher revenue per order exists significantly by journey.** Purchase Abandonment has lower AOV (~$550) compared to other journeys (~$650–$681), indicating different purchase behaviors.
4. **Channel effectiveness varies by journey context.** Some journeys rely more heavily on Email, while others show stronger SMS performance, indicating that optimal channel mix is journey-dependent.

Implication
Optimizing **channel mix within high-impact journeys** — especially Purchase Abandonment — represents the greatest opportunity to increase both revenue and efficiency.

Note: These results reflect a highly engaged, targeted audience and should be validated against broader campaign performance. Could be a factor of the demo data set.

Journey Message Status (AJO)

Panel 4 — Attribution Comparison: Immediate vs Delayed vs Influenced Impact

Omni-Channel - Multi-Industry | This month Apr 1, 2026 - Apr 30, 2026

Panel 4 — Attribution Comparison: Immediate vs Delayed vs Influenced

Table: Attribution Model Comparison — Revenue by Journey and Channel
Rows:
- Retail: Journey Name (AJO)
- Message Channel (Email, SMS, Push)

Metrics:
- Total Revenue (Last Touch | Session)
- Total Revenue (Participation | Person | 14 Days)
- Total Revenue (Participation | Person | 7 Days)

Attribution Model Definitions
- **Last Touch | Session** = Immediate conversion (same session)
- **Last Touch | Person 14 days** = Delayed conversion (cross-session)
- **Participation | Person 14 days** = Full influence across journey

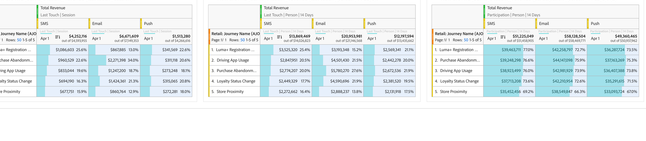
Purpose
- Compare how attribution models impact measured journey and channel performance
- Quantify the difference between **immediate, delayed,** and **influenced** conversion
- Identify which journeys act as **closers** vs **influencers** across the customer lifecycle
- Validate which channels drive **immediate conversion** versus **sustained customer influence**
- Provide a more complete view of how journeys impact **beyond session-based attribution**

Panel 4 — Attribution Comparison: Immediate vs Delayed vs Influenced Impact Insights

Key Insights
1. **Session-based attribution significantly underrepresents total impact.** Revenue increases substantially when moving from Last Touch | Session to Last Touch | Person 14 days, indicating that a large portion of conversions occur after the initial session.
2. **Extended attribution windows further increase measured impact.** Participation | Person 14 days shows higher revenue than Last Touch | Person 14 days, confirming that influence persists beyond immediate conversion.
3. **Journey roles shift from "closers" to "influencers" under broader attribution.** While Purchase Abandonment dominates immediate conversions, other journeys (e.g., Luma+ Registration, Loyalty Status Change) show comparable impact when delayed conversions are included.
4. **Participation attribution reveals widespread journey influence.** Under Participation, all journeys contribute significantly, demonstrating that AJO messaging plays a continuous role throughout the customer journey—not just at the point of conversion.
5. **Channel dynamics differ across attribution models.** Email consistently drives the most total revenue (Email influence), while SMS shows stronger performance in last-touch models (closing power), highlighting distinct roles within the channel mix.

Implication
AJO performance should be evaluated using multiple attribution models: session-based models for measuring execution and conversion efficiency, and person-based models for understanding true cross-channel influence. Optimizing both **high-conversion "closer" journeys** and **high-influence "feeder" journeys** will maximize overall business impact.

Revenue by Journey and Message Channel (last touch | session)



Revenue by Journey and Message Channel (last touch | person | 14 days)

Revenue by Journey and Message Channel (participation | person | 14 days)
