Call Deflection & Digital Self-Service Optimization (in Progress)

Generated on Apr 12, 2026 (U+Greenwich Mean Time, Casablanca (GMT))

Panel 1 — Call Deflection & Digital Self-Service Optimization Executive Overview

Omni-Channel - Multi-Industry | This month Apr 1, 2026 - Apr 30, 2026

Panel 1 — Call Deflection & Digital Self-Service Optimization

This project evaluates how digital customer behavior influences call center demand, with a focus on identifying the drivers of call volume and quantifying their operational cost impact.

By connecting digital sessions to downstream calls, the analysis highlights where customers are unable to complete tasks through self-service and instead escalate to the call center. The goal is to uncover opportunities to improve digital experiences, reduce repeat calling behavior, and lower overall support costs.

Panel 1 — Call Deflection & Digital Self-Service Optimization Insights

Key Insights

- **A small share of digital sessions (7.7%) drives a disproportionately large volume of calls (36.7% penetration).**
- **Repeat calls materially amplify operational demand.** Approximately 106 call triggering sessions generate over 240K total calls, highlighting inefficiencies in issue resolution.
- **Call center demand represents a significant cost burden.** Total call volume drives over $20M in cost, equating to roughly 132 per digital session.
- **Digital self-service is failing to fully resolve customer needs.** Customers frequently escalate to calls and often require multiple interactions to resolve issues.
- **Improving self-service presents a high-impact opportunity.** Even modest reductions in repeat calls or initial call conversion rates could produce meaningful cost savings.

Implication

Reducing repeat calls and improving first-contact resolution in digital channels represents the largest opportunity to lower call center cost.

Panel 2 — Trends & Demand: Digital vs Call Center Volume

Omni-Channel - Multi-Industry | Last 30 full days Mar 13, 2026 - Apr 11, 2026

Panel 2 — Trends & Demand: Digital vs Call Center Volume

Table: Digital & Call Center Demand Trends

Rows:

- Day
- (Optional: Day of Week)

Metrics:

- Digital Sessions
- Calls (Session)
- Digital → Call Sessions
- Digital → Call Rate
- Call Penetration Rate
- Total Cost of Calls

Purpose

- Evaluate how digital engagement and call center demand evolve over time, identifying patterns, variability, and relationships between channels
- Measure whether increases in call volume are driven primarily by higher digital traffic or by inefficiencies in digital self-service (conversion behavior)
- Analyze digital-to-call conversion trends to identify imbalances between traffic-driven and friction-driven call volume
- Identify time periods where elevated call rates suggest breakdowns in the digital experience or external demand drivers.
- Establish a framework for forecasting call center demand, improving staffing alignment, and prioritizing digital experience optimization efforts.

Panel 2 — Trends & Demand: Digital vs Call Center Volume Insights

Key Insights

- **Call volume closely follows digital demand.** Daily call trends generally mirror digital session volume, indicating that call center load is strongly driven by overall digital engagement.
- **Conversion rates remain relatively stable over time.** Digital → Call Rate and Call Penetration Rate show limited day-to-day variation, suggesting consistent underlying customer behavior and system performance.
- **Demand variability is primarily traffic-driven, not efficiency-driven.** Fluctuations in total calls are largely explained by changes in digital session volume rather than significant shifts in conversion rates.
- **Periods of elevated call volume represent predictable operational load.** Recurring peaks in both digital sessions and calls indicate opportunities for improved forecasting and call center staffing alignment.
- **Limited evidence of systemic digital experience breakdowns.** The absence of major spikes in conversion rates suggests that call demand is not being driven by widespread or persistent digital failures.

Implication

Call center demand is largely predictable and driven by digital traffic levels, indicating that optimization efforts should focus on improving overall self-service effectiveness rather than reacting to isolated performance issues.

Section 1 — Core Demand Trends

Panel 3 — Call Reason Analysis

Omni-Channel - Multi-Industry | Last 30 full days Mar 13, 2026 - Apr 11, 2026

Panel 3 — Call Reason Analysis

Table: Call Reason Performance & Escalation Analysis

Rows:

- Call Reason

Metrics:

- Calls (Session)
- % of Total Calls
- Digital → Call Sessions
- Escalation Rate (Digital → Call Sessions / Calls)
- **Avg Cost per Call**
- Total Cost of Calls

Purpose

1. Evaluate the primary drivers of call center demand by identifying which customer issues generate the highest call volume
2. Measure the extent to which calls originate from digital interactions, distinguishing between traffic-driven demand and digital self-service failure
3. Compare call reason performance to identify imbalances between high-volume, high-cost, and high-escalation categories
4. Identify call reasons where elevated escalation rates indicate gaps in digital experience, content, or navigation
5. Establish a framework for prioritizing digital self-service improvements by focusing on issues with the greatest combined impact on volume, escalation, and cost

Panel 3 — Call Reason Analysis Insights

Key Insights

1. **Call volume is highly concentrated among a small set of issues.** A limited number of call reasons—primarily product availability and shopping support—drive a disproportionate share of total call demand.
2. **Product and shopping-related inquiries are the primary drivers of cost.** High-volume call reasons also generate the greatest cost impact, making them the highest priority for optimization.
3. **Digital escalation varies significantly by call reason.** Location and service-related inquiries show the highest escalation rates, indicating customers attempt self-service but are unable to complete these tasks.
4. **Not all calls represent digital failure.** Lower escalation rates for certain call reasons suggest some interactions are expected and may not be suitable for digital deflection.
5. **Digital experience gaps are concentrated, not universal.** Opportunities to reduce call volume are focused within specific call reason categories rather than across the entire experience.

Implication

Targeting high-volume, high-escalation call reasons with improved digital content and self-service capabilities offers the most effective path to reducing call center demand and cost.
